CLAIMLESS INSURANCE - AUTOMATED PAYOUTS

The Problem We're Solving

Quick-commerce delivery workers lose income due to external disruptions like heavy rainfall.

Current gaps:

- No real income protection
- Traditional insurance is slow and claim-heavy
- Workers bear the full financial loss
- City-level weather data is too broad and unfair
- ClaimEasy solves this with automated, hyperlocal, claimless payouts.

Target Persona

Quick-commerce delivery rider
Examples: Zepto / Blinkit worker

Why this persona?

- Works in hyperlocal zones
- Earnings vary by time of day
- Peak-hour income is critical
- Rainfall directly affects mobility and order completion
- Example scenario:
- A Blinkit rider is active from 5pm to 8pm. Heavy rain starts in that exact zone during peak hours, reducing delivery opportunities and expected earnings.

Our Solution: ClaimEasy

ClaimEasy is a web-based parametric insurance platform that protects delivery workers from rainfall-driven income loss through automated, claimless payouts.

01. Worker buys a weekly protection plan and selects their active zone and time slot.

02. Platform tracks the worker's micro-zone and monitors real-time rainfall data.

03. If rainfall triggers are met, payouts are calculated and sent automatically — no claims required.

Product Logic

Weekly Plans

- Basic: ₹20 premium, ₹800 coverage
- Standard: ₹40 premium, ₹2000 coverage
- Pro: ₹60 premium, ₹4000 coverage

Payout Formula

payout = expected_income × severity × eligibility_score

This makes payouts:

- time-sensitive
- zone-specific
- fraud-aware

Rainfall Severity Mapping

- 0–10 mm/hr → 0% payout
- 10–30 mm/hr → 25% payout
- 30–60 mm/hr → 50% payout
- Above 60 mm/hr → 100% payout

AI-Powered Engine

AI/ML Integration

- Income prediction by zone & time slot
- Dynamic weekly pricing (future-ready)
- Worker risk & eligibility scoring

Fraud Detection

- GPS spoofing detection
- Impossible movement tracking
- Activity validation & idle abuse prevention

07

Architecture + Phase 1 Scope Architecture and Phase 1 Plan

Core Architecture

- Worker Web Dashboard
- Backend API
- Weather API
- Zone Resolver
- Income Prediction Engine
- Fraud & Eligibility Engine
- Payout Engine
- Database / Payout Ledger

Phase 1 Prototype Scope

- Worker dashboard
- Weekly plan selection
- Rainfall trigger simulation
- Automated payout calculation
- Fraud-checking logic explanation
